Investing in new or upgraded network equipment is a business decision that depends on high standards for its success. Your ability to generate timely revenue by attracting customers to use new services depends on installation quality.

**Quality without compromise**
As a hardware manufacturer and supplier of both network equipment and professional services, Fujitsu takes pride in the highest quality standards. Our best practices are renowned throughout the industry. We understand how strong quality control measures support successful service delivery and drastically reduce rollout delays and consequent revenue loss. When you have SLAs to uphold, quality and the bottom line go hand-in-hand.

Based on our own stringent internal quality processes and procedures, the Fujitsu Quality Audit service provides you with assurance that your network installation has been performed to documented quality standards. With this guarantee in place, you can proceed to test and turn-up your new installation. As a result, you identify and remedy defects that are more costly to diagnose during testing or worse, after services have been rolled out.

**Simple, thorough, effective**
The Fujitsu Quality Audit service is a simple and highly effective method of installation quality assurance. This service is available for installations performed by any vendor, and for both Fujitsu and non-Fujitsu equipment.

We assign certified quality engineers to visit your site and assess your completed installation, before you begin test and turn-up. These engineers comb through your site and make careful records of everything they find. Equipment, wiring, facilities and onsite installation technicians are all given a pass/fail status. In every instance where standards are not met, the Fujitsu auditors make a specific recommendation for remedial action. All findings and corrective recommendations are then delivered to you in an exhaustive audit report, including clearly labeled photographic documentation where appropriate.
A Fujitsu Quality Audit verifies that your installation is performed to Telcordia GR1275-CORE, and/or to all applicable customer-specific or equipment-specific quality standards.

The scope of the Fujitsu Quality Audit service includes:

- Bay assembly and markings
- Ironwork
- Cable racking
- Cabling
- Wiring conformity
- Fiber ducts
- Bonding & grounding
- Power connections
- Connections
- Recordkeeping and documentation
- Staff professionalism and workmanship
- Housekeeping and cleanliness
- Environmental controls
- Others as detailed in GR-1275

No matter who installs your equipment, your business depends on it being properly installed. A day spent waiting on unexpected corrections and rework is a day spent without generating revenue. It’s simple: quality is not negotiable. By choosing the Fujitsu Quality Audit service, you let us centralize all of your engineering quality function, freeing up personnel while you concentrate on running your business.
